

**AMENDMENTS TO THE CLAIMS**

1. (Original) A monomer of formula (Im):

wherein each Ar is the same or different and independently represents an optionally substituted phenyl or biphenyl; Ar<sup>1</sup> represents an optionally substituted phenyl or biphenyl; each P is the same or different and independently represents a leaving group capable of participating in metal insertion with a nickel or palladium complex catalyst; n is at least 2; and each R is a group of formula (II):

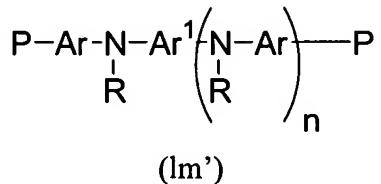

wherein G is hydrogen or a substituent selected from C<sub>1-20</sub> alkyl; C<sub>1-20</sub> alkoxy; C<sub>1-20</sub> fluoroalkyl; C<sub>1-20</sub> perfluoroalkyl; and fluorine.

2. (Original) A monomer according to claim 1 wherein each P is the same or different and is independently selected from halogen; a reactive boronic group selected from a boronic acid group, a boronic ester group and a borane group; a group of formula -B-Hal<sub>3</sub><sup>-</sup> M<sup>+</sup> or DZ-B-Hal<sub>3</sub> wherein each Hal independently represents a halogen, M represents a metal cation and DZ represents diazonium; a group of formula wherein each Hal independently represents a halogen and M represents a metal cation a group of formula O-SIR<sup>7</sup><sub>3</sub> wherein each R<sup>7</sup> independently represents an optionally substituted alkyl or aryl; or a moiety of formula -O-SO<sub>2</sub>-Z wherein Z is selected from the group consisting of optionally substituted alkyl and aryl.

3. (Currently amended) A monomer according to claim 1 or 2 wherein n is 2 or 3.

4. (Original) A process for preparing a polymer comprising the step of polymerizing the monomer of formula (lm')

wherein each Ar is the same or different and independently represents an optionally substituted aryl or heteroaryl; Ar<sup>1</sup> represents an optionally substituted aryl or heteroaryl; each R is the same or different and independently represents a substituent; each P is the same or different and independently represents a leaving group capable of participating in metal insertion with a nickel or palladium complex catalyst; and n is at least 2.

5. (Currently amended) A process according to claim 4 wherein each P is independently a halogen or a moiety of formula –O-SO<sub>2</sub>-Z and the monomer of formula (lm) is polymerised polymerized in the presence of a nickel complex catalyst.

6. (Currently amended) A process according to claim 4 wherein each P is independently a halogen or a moiety of formula –O-SO<sub>2</sub>-Z, the monomer of formula (lm) is polymerized with a second monomer having at least two reactive boron functional groups independently selected from a boronic acid group, a boronic ester group and a borane group, and the polymersation polymerization is performed in the presence of a palladium complex catalyst and a base.

7. (Currently amended) A process according to claim 4 wherein each P is independently a reactive boron functional group selected from a boronic acid group, a boronic ester group and a borane group; the monomer of formula (lm) is polymerised polymerized with a second monomer having at least two substituents independently selected from halogen or a moiety of formula –O-SO<sub>2</sub>-Z; and the polymerization polymerization is performed in the presence of a palladium complex catalyst and a base.

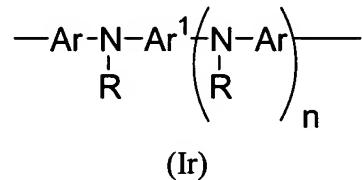

8. (Currently amended) A process according to claim 4 wherein one P is a halogen or a moiety of formula –O-SO<sub>2</sub>-Z and the other P is a reactive boron functional group selected from a

boronic acid group, a boronic ester group and a borane group, and the ~~polymerisation~~ ~~polymerization~~ is performed in the presence of a palladium complex catalyst and a base.

9. (Currently amended) A process according to ~~any one of claims 4-8~~ claim 4 wherein the monomer of formula (lm) is ~~polymerised~~ polymerized with a second monomer selected from the group consisting of optionally substituted aryl and heteroaryl groups.

10. (Original) A process according to claim 9 wherein the second monomer is selected from the group consisting of optionally substituted phenyl, fluorene, spirobifluorene, indenofluorene and heteroaryl.

11. (Original) A co-polymer comprising a first repeat unit of formula (lr) and a second repeat unit Ar<sup>2</sup>:

wherein each Ar is the same or different and independently represents an optionally substituted aryl or heteroaryl; Ar<sup>1</sup> represents an optionally substituted aryl or heteroaryl; each R is the same or different and independently represents a substituent; n is at least 2; and Ar<sup>2</sup> represents an optionally substituted aryl or heteroaryl that has a backbone consisting of aryl or heteroaryl groups and that is directly linked and conjugated to Ar of the first repeat unit of formula (lr).

12. (Original) A co-polymer according to claim 11 wherein Ar2 is selected from the group consisting of optionally substituted phenyl, fluorene, spirobifluorene, indenofluorene and heteroaryl.

13. (Currently amended) An optical device comprising a first electrode for injection of charge carriers of a first type, a second electrode for injection of charge carriers of a second type and a polymer according to claim 11 ~~or 12~~ located between the first and second electrodes.

14. (Currently amended) A method of forming an optical device comprising

- depositing from solution a polymer according to claim 11 ~~or 12~~ onto a substrate carrying a first electrode for injection of charge carriers of a first type, and
- depositing over the polymer a second electrode for injection of charge carriers of a second type.

15. (Currently amended) A switching device comprising a polymer according to claim 11 ~~or 12~~.

16. (Currently amended) A field effect transistor comprising, in sequence, a gate electrode; an insulator; a polymer according to claim 11 ~~or 12~~; and a drain electrode and a source electrode on the polymer.

17. (Original) An integrated circuit comprising a field effect transistor according to claim 16.
